

I cloned what Cobi sells, and fixed what it does.

Vireo reads your customer spreadsheets and hands you a short list of things to act on this week. Every item carries the evidence that produced it, an owner, a due date and a status. If it cannot answer you, it says so instead of inventing a number.

WHAT I FOUND WHEN I READ ALL 66 PAGES OF THEIR DOCUMENTATION

THEIR MARKETING SAYS “AI Decision Stack for Customer Intelligence. Cobi reads their actual behaviour and shows you exactly what to do about it.”	THEIR DOCUMENTATION SAYS “An AI-powered data analytics platform that lets you ask questions about your data in plain English, no SQL required.”
The word “decision” appears 0 times in their docs	Their “Act” pillar is labelled Coming next
30 integrations advertised, 3 documented	Recommendations return bare IDs, no reason, no score

What I took from them

Their surface is good, and most of it is what people pay for. I built all of it.

- 01

Ask in plain English

Type a question about your customers, get an answer back.
- 02

Saved segments

Groups of customers built from rules. Describe a group in words and it writes the rules for you.
- 03

Metrics, charts and dashboards

Save a number, put it on a board, come back to it.
- 04

Stories

A report you can run again, on a weekly schedule, and export.
- 05

An embeddable question box

Put it on another website with one line of HTML.
- 06

Data scopes

A key can only read certain tables, and only the rows belonging to one customer.
- 07

Customer state labels

At risk, Dormant, Power user, Upsell ready, and the rest.
- 08

The dot grid

Their single best idea. One dot is one person, so “36 of 120” is a picture.

What I changed

Their method is measured to fail on real data. These are the differences that matter.

- 01

No free-form SQL

Their approach scores 86% in tests and 0–6% on real company databases. Vireo uses a fixed list of nine questions, each with a query written by hand.
- 02

“I cannot answer that” is a real answer

It refuses, and shows you what it checked. A wrong number that looks right does more damage than ten right ones repair.
- 03

Every number opens onto its evidence

One click from the figure to the rows it counted.
- 04

A decision is a record, not an alert

It has an owner, a due date, a status and an outcome. It comes back if you ignore it.
- 05

Definitions live next to the number

Wrong figure? Edit what it counted, right there. Cobi makes you leave and edit a block of prose.
- 06

A scope cannot widen quietly

Their own docs admit deleting a scope exposes more data. Here, widening one names the live keys and asks first.
- 07

Charts say what they left out

A capped chart prints how many points are missing, so the picture never quietly disagrees with the number above it.
- 08

It works with no internet and no AI model

Answers fall back to keyword matching, and say that is what happened.

455

tests, all passing

70

working routes

14

screens built new

66

of their pages read

3

security holes closed

The three security holes were already there before this work. Any website could have made changes to your workspace, the app could be framed by any page, and editing a data scope could widen it under a live key. All three were found by attacking a running copy, not by reading the code.
